

Practice Project: Validation of an Email ID

Write up for email validation:

Step1 - START

Step 2 - Initialize an array of email IDs (already registered in a company).

Step 3 - Prompt the user to enter an email ID to search for

Step 4 - Read the user input using Scanner class

Step 5 - Set a boolean variable found to false

Step 6 - Loop through the array of email IDs

Step 7 - Compare each email ID to the search email ID using the equals method.

Step 8 - If a match is found, set the found variable to true and break out of the loop

Step 9 - Print the result based on the value of the found variable.

Step 10 - Stop
